No. 2.1e+02; 8; Conservative 0; Mismatches 1; 1   1   1   1   1   1   1   1   1	NT 19	library is a subtracted library derived from the UI-R-CI library, which is a subtracted library derived from the UI-R-CO library. The UI-R-CO library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8.12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dor track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-C2p) was constructed as follows: PCR amplified cDNA inserts from UI-R-C1 clones from which 3' ESTS had been derived was used as a driver in a hybridization with the UI-R-C1 library in the form of single-stranded circles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This PCR primer (with primers AAT79541-44) flanks the TATA box sequence cupstream of the wridine diphosphate glucuronosyltransferase (UGT) gene CL 1*1 exon 1 (see AAT79540), and was used to amplify fragments of 253-255 CC bp. This gene is known to be associated with Gilbert's syndrome (GS). GS CC is a mild, common form of unconjugated hyperbilirubinaemia associated with reduced bilirubin glucuronidation capacity. Analysis of the genetic basis of GS has allowed 2 forms to be identified. One is a mild form CC associated with a homozygous 2 bp insertion in the TATA sequence cupstream of the GCT1*1 exon 1, and the other is a more severe form CC associated with heterozygous 2 bp insertion in the TATA sequence cupstream of the Heterozygous 7 disease. The first form is autosomal cassociated with heterozygous for a mutation which, when homozygous, CC causes Crigler-Najjar type 2 disease. The first form is autosomal recessive and the second is inherited dominantly. Patients suffering from CG sy which is benign, may have altered metabolism of some drugs, making it clifficult to determine if an effect is due to the drug or the syndrome. CC upper trial efficiency would be improved if potential participants can be screened for the genetic basis of GS, and eliminated or included on hasis of them processive in the contractor of the drug or the syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC Nucleotide sequences AAZ45110-Z45118 are exons 1A-1J of the human CC uridine diphosphate-glucuronosyltransferase I (UGT1) gene. The UGTs are a CC family of enzymes that catalyse the glucuronic acid conjugation of a wide CR range of endogenous and exogenous substrates including phenois, actalyse the substrates including phenois. CC result in toxic substances being converted to compounds which are more CR vater soluble and are excreted. The invention relates to and identifies CR UGT1 polymorphisms (AAZ45004-Z45041). The polymorphisms sequences are CR useful as probes for detecting UGT1 locus polymorphisms, indicative of CR altered UGT1 expression or activity. These polymorphisms are associated CR with Crigler-Najjar and Gilbert syndromes (unconjugated thyperbilirubinamia) and drug metabolism. The genotyping of the UGT1 gene is used to predict the rate of metabolism of UGT1 substrates, possible drug-drug interactions and adverse side effects (i.e. to optimize drug consequences, including polymorphisms, can also be used to produce the CR corresponding protein (or its fragments) or to generate transgenic animals or modified cells e.g. for pharmacogenetic screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

(6) about 69 kb of non-sequenced DNA.
(6) about 69 kb of non-sequenced by
(7) the six different first exons and identical C-termini of 246 amino
(8) acids are encoded by the common exons 2-5. The UGT1 gene locus
(9) encodes a family of UDP-glucuronosyl transferase isozymes, two of
(9) which metabolise bilirubin.
(10) Patients having Crigler-Najjar Syndrome (CN) Type I, have a
mutation present in the second common exon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated gene locus UGT1, DNA segments and diagnostic probes for diagnosing Gilbert's disease and Crigler-Najjar syndrome types I and II

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immune response against group A Streptococcus. Antibodies against GRAB are useful for treating Streptococcus pyogenes infections. The protein is also useful for purifying alpha2M from a sample. The present sequencies a DNA encoding partial GRAB protein from S. pyogenes strain KTL3. The protein has alpha2M binding region and is useful in vaccine

CC polyniclectides which are useful for preventing, treating or ameliorating conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the secreted polypeptides in a sample or by determining the presence of mutations in the polynucleotides. Specific uses are described for each cof the products, based on which tissues they are most highly compressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, cNS disorders, abnormalities and foetal deficiencies, blood disorders, CNS disorders, cdiseases of the immune system, autoimmune diseases, hepatic and renal cdisease, diabetes, inflammation, allergies, ischemic shock, Alzheimer's and cognitive disorders, schizophrenia, cardiovascular disorders, prostate diseases, arthritis or malignancies, diseases of testes, lung or thomus, digestive/endocrine disorders, infections and AIDS. The collyward lase are also messel, for identifications and AIDS. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC This DNA sequence encodes a novel soluble toxin (see AAW6027) of CB Bacillus thuringlensis (B.t.) strain PS196F3 (NRRL B-21872). This CC toxin belongs to the novel MIS-6 family of B.t. toxins that have coxicity against non-mammalian pests. The novel DNA was obtained DY PCR amplification (see AAW30288-99) of toxal cellular genomic DNA. It can used to produce recombinant hosts (preferably plant CD DNA. It can used to produce recombinant hosts (preferably plant CD DNA. It can used to produce recombinant hosts (preferably plant CD DNA. It can used to produce recombinant hosts (preferably plant CD DNA. It can used to produce recombinant hosts (preferably plant CD DNA. It can used to produce solution, or as a PCR primer or hybridisation probe for use in identifying and characterising CD DNA is a post of the control of the control of toxins (see AAW60218-32) which have activity against CD DNA toxins (see AAW60218-32) which have activity against CD DNA toxins (see AAW60218-32) which have activity against CD DNA toxins (see AAW60218-32) and AAM9973-87), and transformed host CD CO DNA toxins are also useful to their ability to form pores in cell membranes, and can be used to for their ability to form pores in cell membranes, and can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               receptor related protein, previously designated LRP-3) isoform 2 CDNA. Nucleic acid molecules (NRMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Allheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases, such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the longest open reading frame of LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3) CDNA from the present invention. cc receptor related protein, previously designated LRP-3). The present CC sequence represents the putative open reading frame of LRP5 isoform 3. CC Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining CC if an individual is susceptible to insulin dependent diabetes mellitus CC (IDM). The NAMS or proteins can be used for reducing triglyceride levels CC useful in the treatment of autoimmune diseases such as CC glomerulonephritis, diseases and disorders involving disruption of condections and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, contamination, pathogenic bacterial toxin contamination, contamination, osteoporosis, Alzheimer's disease and cardiovascular disease. Products CC drug screening.
  New isolated LDL-receptor related protein - used to develop for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 1998-594573/50.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence represents the LRP5 isoform 5 cDNA.

Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride level in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as
                                                                                New isolated LDL-receptor related protein - used to develop products for treating. e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     05-JUN-1997;

#69 TO 12

三世 から 一世の

The present invention describes LRPS (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). The present sequence represents the LrpS isoform 3 cDNA.

Nucleic acid molecules (NAMs) encoding LRPS can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus

Example 1; Fig 12a; 200pp; English.

Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be
                                                                                                                                  for treating, e.g. elevated trigiyo autoimmune disorders, inflammation
                                                                                                                                    New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease
                                                                                                                                                                                                          WPI; 1998-594573/50.

 useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving d
                           Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride level in the serum of an individual. Therapies that affect LRP5 may also be

receptor related protein, previously designated LRP-3). The present sequence represents the LRP5 isoform 2 Day Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride level in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endovrous and anticommune content of autoint and disorders involving disruption of endovrous and anticommune proteins and the present and the content of anticommune diseases and the present and the p

levels be

The present invention describes LRP5 (low density lipoprotein (LDL)

Claim 8; Fig 11a; 200pp; English.

New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease

/clone_lib="RPCI-11" /clone_3. 192 /rpt_family="L1" region 221528	The clone RP11-154L24 contains a tandem repeat from base positions 38234 to 39039, this region contains some low quality data. The assembly is consistent with the restriction digest information. Location/Qualifiers 168770 /Organism="Homo sapiens" //bb_xref="raxon:9606" //chromosome="2" //clone="RP11-164124"	SOURCE INFORMATION: The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An Improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from and coworkers at the Roswell Park Cancer Institute (http://www.resgen.com) or Pieter de Jong (http://bcpac.med.buffalo.edu) VECTOR: pBACe3.6 MEIGHBORING SEQUENCE INFORMATION: The clone sequenced to the left is RP11-332L11, 200 bp overlap. Actual start of this clone is at base position 86134 of RP11-154L24.	MAPPING INFORMATION: Mapping information for this clone was provided by Dr. John D. Mapping information for denetics, Washington University, St. Louis MCPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc	This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >- 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.	NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions. Gaps between the courty care represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Direct Submission

                                                                                                                                   on Jun 4, 2000 this sequence version replaced g1:8018160. During sequence assembly data is compared from overlapping clones, where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known that the contract contracts of the contract of the contra
                    The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
                                                                                            annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
